

Amazon Web Services

Google

Apple

Company	Technology Stack	Notes
AWS (Amazon Web Services)	CloudFormation, java, python, Sam,etc. Heavily dependent on what branch of AWS you work in.	Amazon backend technology appears to be java or jvm. AWS changed the way companies store data by use of cloud storage.
Google	Java, C++, or Python.	Google makes it hard to pin down the exact programs used, but I did find a posting for an AI engineer job which required knowledge of Java, C++, python. Like most big tech companies they expect their employees to have a good understanding of google cloud, which is their own version of a cloud database. Cloud based technologies were mentioned in many of their job postings.
Apple	Swift, appcode, ios SDK	iOS developers at Apple use Swift, appcode and ios SDK primarily. Much like AWS and Google, Apple is a very large company which utilizes a variety of tech stacks dependent on the team you work with.
